

URL Shortener

For custom product recommendation links, rebuy wants to enter the URL shortener market with similar functionality of <https://bitly.com/>.

As a developer at rebuy, you have a lot of freedom, but need to make decisions with your team on how to build products. In this challenge, **your task is to build a working URL shortener application** that fulfills the MVP requirements below.

Time limit: 3-4 hours maximum

MVP Requirements

Build a functional application with these features:

- The shortened URL hash has to be four chars long
- No limit on the range of usable chars for the hash, except special URL chars
- The interface consists of a form where the user can enter the full URL and, after confirming, will receive the shortened URL
- Requesting the shortened URL will redirect the client to the target URL
- We want to enter the market as quick as possible

Technical Requirements

- Build both backend API and simple frontend interface
- Use any backend framework/language you're comfortable with
- Include data persistence (database, file system, or in-memory)
- Basic frontend form (can be simple HTML/CSS/JS)

Deliverables

1. **Working application** - all features implemented and functional
2. **Source code** - clean, well-structured repository
3. **README** - setup instructions and brief notes on your technical decisions

What's Next?

If your submission meets our standards, we'll invite you to a technical interview where you'll walk through your code and implement a small additional feature.

Submission

Send us your repository link or zip file.

Have fun with this task! 🚀
